Ananda Sukprasert

Senior Backend Engineer — Go, PostgreSQL, payments, DevOps

ananda.s@example.com · +66 00 000 0001 · Bangkok

Summary

Backend engineer with seven years of production Go, six of them building payment systems. I own what I build from code to production — pipelines, infrastructure and on-call — and I like teaching others to do the same.

Experience

Senior Backend Engineer, Example Pay Co., Ltd. — 2021 – present

- Lead a team of four building the card-payment authorisation service in Go, handling 1,200 transactions per second at peak.
- Designed the PostgreSQL ledger schema (double-entry, 40 million rows a month) and its partitioning; cut month-end reconciliation from six hours to twenty minutes.
- Moved settlement events onto Kafka with idempotent consumers, removing a class of duplicate-payout incidents.
- Built the team's DevOps platform: GitHub Actions pipelines that test, scan and deploy every service to Kubernetes with Argo CD, about 30 releases a week.
- Manage the AWS infrastructure as code with Terraform (EKS, RDS for PostgreSQL, MSK), reviewed and applied through pull requests.
- Set up monitoring and alerting with Prometheus, Grafana and PagerDuty; lead the on-call rotation and its incident reviews.

Backend Engineer, Sample Wallet Ltd. — 2018 – 2021

- Built the top-up and transfer APIs in Go on PostgreSQL for a mobile wallet with 2 million users.
- Introduced RabbitMQ for notification fan-out and wrote the retry and dead-letter handling.
- Mentored three junior engineers through their first production releases.

Skills

Go (7 years), PostgreSQL, Kafka, RabbitMQ, Docker, Kubernetes, Terraform, GitHub Actions, Argo CD, Prometheus, Grafana, AWS, gRPC, payment systems, PCI DSS

Education

B.Eng. Computer Engineering, Example Institute of Technology, 2017
